

API Endpoints for the Admin Portal

To bring your two HTML pages to life, you will need to add these routes to your `API.java` file and build the corresponding methods in `APIHandler.java`.

Crucial SaaS Rule: Every one of these endpoints must extract the `tenantId` from the JWT Bouncer to ensure you only query data for Zen 63.

1. Pricing & Menu Page (`admin_dashboard.html`)

This page manages the `catalog_items` table.

- `GET /api/private/catalog`
 - **Action:** Fetches all items `WHERE tenant_id = ? AND deleted_at IS NULL`.
 - **Returns:** Array of JSON objects containing `id`, `name`, `category`, `price`, and `status`.
- `PUT /api/private/catalog/{id}/price`
 - **Action:** Updates the `base_price` of a specific item.
 - **Body:** `{ "price": 95.00 }`
- `POST /api/private/catalog`
 - **Action:** For the "Add Item" button. Inserts a new row into `catalog_items`.

2. Main Overview Page (`admin_overview.html`)

This page requires aggregating data from multiple tables (`orders` , `reservations` , `restaurant_tables`).

- `GET /api/private/dashboard/stats`
 - **Action:** Runs SQL aggregations for the top 4 cards.
 - *Revenue:* `SUM(total_amount)` from `orders` created today.
 - *Pending Bookings:* `COUNT(*)` from `reservations` where `status = 'pending'`.
 - *Active Tables:* Count of `orders` where `status = 'open'`.
- `GET /api/private/reservations/pending`
 - **Action:** Fetches rows from the `reservations` table (with the JSONB details) to populate the table.
- `PUT /api/private/reservations/{id}/status`
 - **Action:** For the green/red Approve/Decline buttons. Updates the status to 'confirmed' or 'cancelled'.
- `GET /api/private/dashboard/activity`
 - **Action:** A simple query fetching the 5 most recently updated rows from `orders` or `order_items` to populate the "Live Activity" feed.

Recommended Implementation Order:

1. Run the seed data SQL.
2. Build `GET /api/private/catalog` so you can render your table dynamically.
3. Build `PUT /api/private/catalog/{id}/price` to make the edit modal work.
